1. The one chart that changes decisions (Recommended)
2. How to read your trend baseline
3. This signal matters more than daily noise

Preview Text

Most people react to single-day spikes. Trends tell the real story.

Hi [First Name],

If you only look at one day, everything feels random.

If you look at two weeks, patterns appear.

That is why your 14-day baseline is one of the most useful views in xHeal. It helps you separate normal noise from meaningful drift.

Use this simple rule:

- One bad day = information
- Three similar days = pattern
- Repeated pattern + same trigger = action point

Today, open your trend view and answer one question:

"What changed before my last symptom spike?"

That one answer is often where better decisions start.
